

FITFLOW

Wellness & Fitness Mobile App

UI/UX Case Study & Portfolio Plan

Prepared by: Anjali Awadhwal

Project type: Mobile App • UX Research • UI Design • Prototyping

Design tool: Figma

This case study follows the course assignment brief and the Wellness & Fitness App capstone requirements. It documents the problem, research direction, competitive review, personas, information architecture, user flow, wireframes, visual design, refinement approach, accessibility, and portfolio plan.

01. Project Overview

Project: FitFlow — a personalized wellness and fitness companion designed to help users set goals, follow workouts, plan meals, monitor progress, and stay motivated.

Project goal: Turn a broad fitness journey into a simple, connected experience instead of forcing users to manage separate tools for workouts, nutrition, progress, and motivation.

Core value proposition: One place to plan, track, understand, and improve a user's wellness journey.

The capstone brief calls for goal setting, progress tracking, workout plans, nutrition, social challenges, analytics, personalized recommendations, reminders, wearable integration, accessibility, and a clear mobile page structure.

■filecite■turn4file3■L256-L275■

Case-study scope

- Goal setting and progress tracking
- Workout plans and exercise library
- Nutrition and meal planning
- Challenges and community motivation
- Health insights and analytics
- Personalized recommendations and reminders

02. Problem Statement & User Challenges

Staying fit and maintaining a healthy lifestyle can be difficult when people balance work, family, and personal commitments. Fitness experiences can also become fragmented when workouts, nutrition, progress and motivation are handled in separate places.

Design challenge: How might we make daily fitness decisions simpler by connecting a user's goal, recommended action, tracking and feedback in one continuous journey?

Key user challenges

- Difficulty maintaining consistency and motivation.
- Too many disconnected fitness and nutrition tools.
- Unclear next steps after setting a fitness goal.
- Generic recommendations that do not adapt to personal goals.
- Progress data can feel overwhelming instead of actionable.
- Busy users need short, flexible plans that fit their schedule.

These challenges align with the case-study source material and the capstone brief's focus on personalized goals, tracking, motivation, nutrition and seamless navigation. ■filecite■turn5file1■L51-L65■

03. UX Research Insights

Research approach

The project uses secondary research, competitor-pattern review and the target-user requirements defined in the capstone brief. The brief asks the designer to research common fitness goals, user preferences, pain points and emerging digital-wellness trends such as wearable integration and personalized coaching.

■filecite■turn4file3■L585-L598■

Key insights

- Personalization matters: recommendations should reflect goals, fitness level, available time and preferences.
- Progress should be visible: rings, bars, trends, streaks and milestones make progress easier to understand.
- Convenience supports consistency: quick workouts, flexible plans, meal planning and reminders reduce friction.
- Motivation can be social: challenges, achievements and community features can encourage continued use.
- Data needs interpretation: dashboards should translate metrics into understandable insights and next actions.
- Accessibility should be built in through readable type, strong contrast, clear states and customization.

Important research note

No participant survey/interview results were provided in the source material. Therefore, this submission does **not** invent participant responses. The next section provides a ready-to-run survey/interview plan that can be used to validate the design with real users.

04. Competitive Analysis

The capstone requires comparison of 3–5 fitness apps across features, strengths and weaknesses, followed by identification of gaps that can inform the new product. ■filecite■turn4file3■L571-L584■

Product	Key strengths	Weakness / opportunity
MyFitnessPal	Strong food logging and nutrition tracking	Can feel data-heavy; opportunity for a unified goal-to-action journey
Nike Training Club	Guided workouts and polished training content	Nutrition and broader wellness tracking are less central
Fitbit	Activity tracking, health metrics and wearable ecosystem	Hardware/ecosystem dependency can add complexity
Strava	Community, activities, challenges and motivation	Less focused on complete nutrition and everyday wellness planning
Cult.fit	Workout, wellness and fitness-service ecosystem	Opportunity for a simpler, personalized daily dashboard

Design takeaway: FitFlow differentiates through integration: goals, workouts, nutrition, progress, insights and motivation are connected rather than treated as isolated features.

05. Mood Board & Visual Direction

The visual direction is fresh, energetic and trustworthy. The system uses a soft background, teal/green accents, rounded cards, clear hierarchy and simple iconography. The capstone specifically asks the mood board to communicate health, energy, motivation and clarity. ■filecite■turn4file3■L599-L611■

Typography: bold, readable headings with short supporting text for fast scanning.

Color direction: teal/green as the primary wellness accent with light neutral surfaces.

UI language: rounded cards, progress components, clear CTAs and consistent navigation.

06. User Personas

The capstone requires at least two personas based on the target audience. The target groups include fitness enthusiasts, beginners, health-conscious users, busy professionals, rehabilitation users, socially engaged users and wearable-tech users. ■filecite■turn4file3■L397-L404■

Persona 1 — Riya Sharma, 27 | Working Professional

Goal: Improve fitness and maintain healthy habits.

Behaviors: Uses mobile apps daily, prefers short guided workouts, tracks meals occasionally and benefits from reminders.

Pain points: Inconsistent routine, too many apps and motivation drops after missed days.

Motivations: Visible progress, personalized suggestions, streaks and achievable goals.

Persona 2 — Arjun Mehta, 34 | Busy Professional

Goal: Build strength and stay consistent.

Behaviors: Has limited free time, prefers structured plans, wants progress insights and uses wearable devices.

Pain points: Long workouts are difficult to fit in, data is scattered and next steps are unclear.

Motivations: Efficient workouts, clear analytics and goal-based recommendations.

Primary design principle: the app should feel useful within seconds of opening—show today's goal, one clear recommended action and meaningful progress without requiring deep navigation.

07. Survey / Interview Plan & Insights

The capstone asks for a short survey or user interview and responses about habits, app usage patterns and preferences. ■filecite■turn4file3■L612-L641■

Ready-to-run survey questions

- What is your primary fitness goal?
- How many days per week do you normally exercise?
- Which fitness-app features do you use most?
- What frustrates you most about fitness apps?
- Do you prefer short workouts or longer structured sessions?
- How useful are reminders for keeping you consistent?
- Would you use personalized workout or meal recommendations?
- Would challenges or streaks motivate you to continue?
- Do you use a smartwatch or fitness band?
- What would make a fitness app easier to use?

Research themes to validate

The current design hypothesis is that users value simplicity, personalization, visible progress, flexible routines and motivation. These are **design hypotheses**, not claimed participant results. A real 8–10 person sample would make this section evidence-based.

08. Information Architecture & User Flow

The capstone asks for a visual sitemap/hierarchy and a user journey from onboarding to achieving fitness goals.

■filecite■turn4file3■L624-L635■

HOME	GOALS	WORKOUTS	NUTRITION	CHALLENGES	INSIGHTS	PROFILE
Today	Goal selection	Plans	Meal plan	Discover	Metrics	Preferences
Progress	Target	Exercise library	Recipes	Join	Trends	Wearables
Recommendations	Timeline	Filters	Water	Leaderboard	Summary	Notifications
Quick actions	Milestones	Calendar	Grocery list	Community	Tips	Accessibility

Core user flow

Onboarding → Choose goal → Personalize preferences → Home dashboard → Recommended workout/meal → Log activity → View progress → Receive insight/reward → Adjust goal

Flow principle: every major action should lead to a visible outcome—completion, progress, recommendation, streak or insight.

09. Step-by-Step Design Process

1. **Ideation:** define the fragmented fitness journey and identify an integrated wellness direction.
2. **Research synthesis:** review user needs, competitor patterns, fitness goals and wellness trends.
3. **Information architecture:** group features into predictable sections.
4. **Wireframing:** decide hierarchy, content structure, CTA placement and navigation before styling.
5. **Visual design:** apply a clean, energetic mobile UI with consistent components.
6. **Prototyping:** connect goal selection, workout discovery, progress tracking and core navigation.
7. **Review & refinement:** reduce unnecessary steps, clarify labels and improve scanability.

Key design decisions

- Prioritize today's most important action on Home.
- Use cards and progress components to organize dense information.
- Keep bottom navigation predictable across primary sections.
- Use goal-based recommendations instead of generic content.
- Translate raw metrics into understandable summaries and next actions.

10. Low-Fidelity Wireframes

The wireframes focus on layout, navigation, content structure, button placement and user-flow connections before detailed visual styling, as required by the capstone brief. ■filecite■turn4file3■L237-L247■

10. Low-Fidelity Wireframes — Continued

Nutrition Wireframe

Challenges Wireframe

Profile Wireframe

11. High-Fidelity UI Screens

The high-fidelity direction follows the assignment's requirement to show progression from structure to polished UI. The screen set covers the core journey and the major app sections defined in the capstone.

11. High-Fidelity UI Screens — Continued

12. Challenges, Usability Review & Design Refinements

No participant-test transcript was supplied, so this section does not fabricate user-testing results. Instead, it records a **heuristic design review** against the intended user tasks and identifies refinements to demonstrate in the prototype.

Challenge → resolution

Feature overload → group related features into predictable sections and surface only the most relevant actions on Home.

Data overload → prioritize a few key metrics and use summaries, trends and recommendations.

Motivation drops → use supportive streak messages, achievable milestones and progress feedback.

Personalization without complexity → collect only essential preferences and personalize progressively.

Usability review checklist

- Can a new user understand the Home screen immediately?
- Can a user set or edit a goal without confusion?
- Can a user find a suitable workout quickly?
- Can a user understand what their progress means?
- Are primary actions visually obvious?
- Can users recover easily after making a wrong selection?

Prototype refinement priorities: clearer labels, fewer steps, visible feedback after completion, consistent navigation and stronger accessibility states.

13. Accessibility Report

Accessibility is considered as part of the interface system rather than as a final add-on.

- Use high-contrast text and controls.
- Maintain readable typography and clear hierarchy.
- Do not rely on color alone to communicate status.
- Pair icons with meaningful labels where necessary.
- Use clear button names and active/focus states.
- Support larger text without breaking layout.
- Provide a clear accessibility/settings area.
- Keep navigation consistent across screens.

14. Portfolio Platform Comparison

Platform	Customization	Ease	Best for	Decision
Behance	Medium–High	Easy	Detailed visual case studies	Selected
Dribbble	Medium	Easy	UI shots & discovery	Secondary
Notion	Medium	Very easy	Structured portfolio + documentation	Alternative
Webflow	Very high	Medium	Custom portfolio website	Future upgrade

Selected platform: Behance. It is a strong first choice for a beginner UI/UX portfolio because the format supports long-form visual case studies, project images, descriptions and creative presentation. The earlier case-study draft also selected Behance as the recommended first platform. ■filecite■turn4file2■L132-L148■

15. Portfolio Structure

Navigation: Home → About Me → Case Studies → Projects → Skills → Resume → Contact

Home: short introduction, UI/UX focus, selected work and clear contact CTA.

About Me: short bio, design approach, tools, strengths and career goal.

Case Studies: feature FitFlow first and show problem, research, personas, IA, wireframes, decisions, prototype, challenges and learnings.

Contact: email, LinkedIn and relevant professional details.

Additional Past Projects

Project 02 — YouTube Website UX Analysis

Focus: typography, UI components, responsive grid layout, strengths/weaknesses and UX best practices. This demonstrates product analysis as well as interface thinking.

Project 03 — Mini Design System

Focus: color system, typography hierarchy, iconography, reusable components, design tokens and microinteractions. This demonstrates consistency and component thinking.

Visual identity

Use one typography system, one spacing system, consistent thumbnail ratios, consistent project-title formatting and a restrained accent palette. These additional project choices and the portfolio structure are already identified in the supporting case-study material. ■filecite■turn4file0■L15-L25■

16. Final Submission Checklist

- PDF case study completed.
- Selected project: FitFlow Wellness & Fitness App.
- Problem statement and user challenges included.
- UX research insights and competitor analysis included.
- Two user personas included.
- Survey/interview plan included without fabricated participant results.
- Information architecture and user flow included.
- Low-fidelity wireframes included.
- High-fidelity UI screens included.
- Design process and decisions documented.
- Challenges and refinement approach included.
- Accessibility report included.
- Portfolio platform comparison and Behance selection included.
- Portfolio structure included.
- Two additional projects included.
- Live Figma prototype link must be added before final submission.

One remaining action

The assignment expects a live Figma prototype link. The screens in this PDF are ready as visual case-study evidence, but a live clickable Figma URL can only be created after these screens are imported into a Figma file and connected in Prototype mode.

Recommended prototype path: **Splash** → **Home** → **Goals** → **Workouts** → **Nutrition** → **Insights** → **Profile**. Add clickable CTAs and bottom-navigation connections between the core screens.

Submission-ready case study prepared from the provided course assignment and Wellness & Fitness App capstone requirements.
